## Software Developer in Test

Are you interested in testing state-of-the-art neurodiagnostic devices in an exciting and fast-paced agile development environment? Do you have an agile attitude? If so, we have a great Agile software test opportunity for you. You will work with developers, product owners, and other team members to raise any issues with feature design, determine proper testing needs for ongoing releases, write and automate detailed test cases, ensure bugs are identified early and fixed and act as gatekeeper for product releases.

This position is focused on developing test plans, test cases and acceptance tests to ensure successful product release and deployment. You will be working alongside the product developers to refine the requirements and develop automated test cases that demonstrate product readiness for the field.

### Requirements:

- History of successful test or product development experience.
- 5-10 years experience with automation, unit, white and black box testing.
- Strong skills in test case generation. Experience with real-time systems preferred.
- Strong programming experience in C#/.NET. Experience in TFS preferred.
- Knowledge of software life cycle and project management concepts and good task management skills.
- Highly motivated and excellent problem-solving skills.
- BS degree in Computer Science or equivalent.

### Responsibilities include:

- Test case automation, execution, and maintenance for assigned product areas.
- Test planning and case development for product features to ensure complete requirements-to-test-matrix coverage.
- Document and communicate test reports, defect analysis, and risks.
- Champion product issues with product owners and developers to help improve customer experience.
- Lead the software test team.
